[Respiratory Health Effects of Airborne Hazards Exposures in the Southwest Asia Theater of Military Operations](#) National Academies of Sciences, Engineering, and Medicine 2020-10-23 More than 3.7 million U.S. service members have participated in operations taking place in the Southwest Asia Theater of Military Operations since 1990. These operations include the 1990-1991 Persian Gulf War, a post-war stabilization period spanning 1992 through September 2001, and the campaigns undertaken in the

wake of the September 11, 2001, attacks. Deployment to Iraq, Kuwait, Saudi Arabia, Bahrain, Gulf of Aden, Gulf of Oman, Oman, Qatar, the United Arab Emirates, and Afghanistan exposed service members to a number of airborne hazards, including oil-well fire smoke, emissions from open burn pits, dust and sand suspended in the air, and exhaust from diesel vehicles. The effects of these were compounded by stressors like excessive heat and noise that are inevitable attributes of service in a combat environment. Respiratory Health Effects of Airborne Hazards Exposures in the Southwest Asia Theater of Military Operations reviews the scientific evidence regarding respiratory health outcomes in veterans of the Southwest Asia conflicts and identifies research that could feasibly be conducted to address outstanding questions and generate answers, newly emerging technologies that could aid in these efforts, and organizations that the Veterans Administration might partner with to

accomplish this work.

Annual Review of Nursing Research, Volume 34, 2016

Susanne W. Gibbons, PhD, C-ANP/C-GNP 2015-12-20 Annotation

This groundbreaking annual review has provided over three decades of knowledge, insight, and research on topics critical to the field of nursing. The 34th volume presents abundant new research devoted to examining and forwarding the field of modern ethics in nursing. It reflects the rapid acceleration of change in the roles and responsibilities of nurses and the concurrent need for reexamination of professional ethical values. Articles focus on creating nurses who are able to negotiate, adapt, and provide excellent care to patients as they take on greater administrative duties, rely more on technology, and assume some of the roles and responsibilities of physicians. Chapters are comprised of carefully selected articles that underscore the importance of in-depth ethical education and professional character development in the nursing classroom, and its continued evolution as nurses adapt to a changing health care environment throughout their careers. They include examples of contemporary health care dilemmas and how nurses have used ethical values to guide their behavior in situations where they encounter highly vulnerable patients; address ethical problems relating to family issues such as self-neglect and the wellbeing of children in military families; and the systems-of-care issues regarding genetics, smart home technologies for older adults, interprofessional collaboration, and post-deployment reintegration. Key Topics: Nursing Ethics: A Lifelong Commitment Ethical Analysis of Family Impact of Mental Health Stigma Ethical issues in Family Care Ethical Considerations in Self-Neglect The Effects of Parental Service on the Wellbeing of our Youngest Military Members Ethics of Genetics in Primary Care Ethics of Smart Home Technologies for Older Adults Post-Deployment Reintegration: The Ethics of Embodied Personal Presence and the Formation of Military Meaning Ethical Issues

Military Veteran Psychological Health and Social Care Jamie Hacker Hughes 2017-05-12 When servicewomen and men leave the armed forces, their care transfers to the statutory and third sector where the quality and provision of services can vary enormously. This edited book, encompassing a range of perspectives, from service user to professional, provides a comprehensive overview of services available. Each chapter, in turn, examines the policy underpinnings of systems and services covering the psychological health and social care of military veterans and then focuses on the needs of a discrete number of types of military veterans including early service leavers, veterans in the criminal justice system, older veterans and reservists, together with the needs of the children of veterans' families. This is the first UK book to examine the whole spectrum of contemporary approaches to the psychological health and social care of military veterans both in the United Kingdom and overseas. The book is edited by Professor Jamie Hacker Hughes, a former head of healthcare psychology within the UK Ministry of Defence and all contributors are experts in policy, service provision and academic research in this area. It will be of special interest to those designing and planning, commissioning, managing and delivering mental health and social care to military veterans and their families

Evaluation of the Department of Veterans Affairs Mental Health

Services National Academies of Sciences, Engineering, and Medicine 2018-03-29 Approximately 4 million U.S. service members took part in the wars in Afghanistan and Iraq. Shortly after troops started returning from their deployments, some active-duty service members and veterans began experiencing mental health problems. Given the stressors associated with war, it is not surprising that some service members developed such

mental health conditions as posttraumatic stress disorder, depression, and substance use disorder. Subsequent epidemiologic studies conducted on military and veteran populations that served in the operations in Afghanistan and Iraq provided scientific evidence that those who fought were in fact being diagnosed with mental illnesses and experiencing mental health-related outcomes in particular, suicide at a higher rate than the general population. This report provides a comprehensive assessment of the quality, capacity, and access to mental health care services for veterans who served in the Armed Forces in Operation Enduring Freedom/Operation Iraqi Freedom/Operation New Dawn. It includes an analysis of not only the quality and capacity of mental health care services within the Department of Veterans Affairs, but also barriers faced by patients in utilizing those services.

Trauma Jerrold R. Brandell 2019-11-19 An expanded and revised edition of the first social work text to focus specifically on the theoretical and clinical issues associated with trauma, this comprehensive anthology incorporates the latest research in trauma theory and clinical applications. It presents key developments in the conceptualization of trauma and covers a wide range of clinical treatments. Trauma features coverage of emerging therapeutic modalities and clinical themes, focusing on the experiences of historically disenfranchised, marginalized, oppressed, and vulnerable groups. Clinical chapters discuss populations and themes including cultural and historical trauma among Native Americans, the impact of bullying on children and adolescents, the use of art therapy with traumatically bereaved children, historical and present-day trauma experiences of incarcerated African American women, and the effects of trauma treatment on the therapist. Other chapters examine trauma-related interventions derived from diverse theoretical frameworks, such as cognitive-behavioral theory, attachment theory, mindfulness theory, and psychoanalytic theory.

The Mirror Test J. Kael Weston 2016-05-24 A New York Times Editors' Choice A Military Times Best Book of the Year A powerfully written firsthand account of the human costs of conflict. J. Kael Weston spent seven years on the ground in Iraq and Afghanistan working for the U.S. State Department in some of the most dangerous frontline locations. Upon his return home, while traveling the country to pay respect to the dead and wounded, he asked himself: When will these wars end? How will they be remembered and memorialized? What lessons can we learn from them? These are questions with no quick answers, but perhaps ones that might lead to a shared reckoning worthy of the sacrifices of those—troops and civilians alike—whose lives have been changed by more than a decade and a half of war. Weston takes us from Twentynine Palms in California to Fallujah in Iraq, Khost and Helmand in Afghanistan, Maryland, Colorado, Wyoming, and New York City, as well as to out-of-the-way places in Iowa and Texas. We meet generals, corporals and captains, senators and ambassadors, NATO allies, Iraqi truck drivers, city councils, imams and mullahs, Afghan schoolteachers, madrassa and college students, former Taliban fighters and ex-Guantánamo prison detainees, a torture victim, SEAL and Delta Force teams, and many Marines. The overall frame for the book, from which the title is taken, centers on soldiers who have received a grievous wound to the face. There is a moment during their recovery when they must look upon their reconstructed appearance for the first time. This is known as “the mirror test.” From an intricate tapestry of voices and stories—Iraqi, Afghan, and American—Weston delivers a larger mirror test for our nation in its global role. An unflinching and deep examination of the interplay between warfare and diplomacy, this is an essential book—a crucial look at America now, how it is viewed in the world and how the nation views itself.

American Military Life in the 21st Century: Social, Cultural, and Economic Issues and Trends [2 volumes] Eugenia L. Weiss

2018-11-30 A comprehensive guide to the lives and experiences of military service members, veterans, and their families in the United States today, with special emphasis given to those of the post-9/11 era. • Provides readers with a current understanding of the experiences of U.S. service members, veterans, and their families in the post-9/11 era of combat operations in Iraq and Afghanistan • Examines issues pertinent to minority populations in the military and delineates health and mental health issues that affect all combat service members, summarizing evidence-based interventions and access to care • Provides firsthand perspectives and experiences of military-connected families and children • Analyzes societal costs and supports for building military-civilian community connections, including in the transition

What's Next for Student Veterans? David DiRamio 2017-12-21

With the passage of the Post-9/11 GI Bill in 2008, more than 1.4 million service members and their families became eligible for higher education benefits, and veterans from the wars in Iraq and Afghanistan enrolled in colleges and universities in record numbers. The first wave of research about these new student veterans focused primarily on describing their characteristics and the transition from military service to civilian life and the college campus. This new edited collection presents findings from the second wave of research about student veterans, with a focus on data-driven evidence of academic success factors, including persistence, retention, degree completion, and employment after college. An invaluable resource for educators poised to enter the next phase of supporting military-connected college students.

War and Family Life Shelley MacDermid Wadsworth 2015-12-16

This unique resource provides findings and insights regarding the multiple impacts of military duty on service members and veterans, specifically from a family standpoint. Broad areas of coverage include marital and family relationships, parenting issues, family effects of war injuries, and family concerns of single service members. The book's diverse contents highlight

understudied populations and topics gaining wider interest while examining the immediate and long-term impact of service on family functioning. In addition to raising awareness of issues, chapters point to potential solutions including science-based pre- and post-deployment programs, more responsive training for practitioners, and more focused research and policy directions. Among the topics covered: • Deployment and divorce: an in-depth analysis by relevant demographic and military characteristics. • Military couples and posttraumatic stress: interpersonally based behaviors and cognitions as mechanisms of individual and couple distress. • Warfare and parent care: armed conflict and the social logic of child and national protection. • Understanding the experiences of women and LGBT veterans in Department of Veterans Affairs care. • Risk and resilience factors in combat military health care providers. • Tangible, instrumental, and emotional support among homeless veterans. *War and Family Life* offers up-to-date understanding for mental health professionals who serve military families, both in the U.S. and abroad.

Traumatic Brain Injury Jack W. Tsao 2019-11-19 This thoroughly revised and updated work covers numerous advances in traumatic brain injury diagnosis, evaluation, treatment, and pathophysiology. Since publication of the first edition in 2012, there has been greatly increased public awareness of the clinical consequences of even the mildest of head injuries, and the result has been a concerted effort of countries around the world to increase research funding. This second edition continues to focus on mild traumatic brain injury--or concussion--and contains updates to all the original chapters as well as adding new chapters addressing clinical sequelae, including pediatric concussion, visual changes, chronic traumatic encephalopathy, and blast-associated TBI. *Traumatic Brain Injury: A Clinician's Guide to Diagnosis, Management, and Rehabilitation, Second Edition*, is a comprehensive resource designed for neurologists, primary care clinicians, sports physicians, and other medical

providers, including psychologists and neuropsychologists, as well as athletic trainers who may evaluate and care for individuals who have sustained a TBI. The book features summaries of the most pertinent areas of diagnosis and therapy, which can be readily accessed by the busy clinician/professional. In addition, the book's treatment algorithms provide a highly practical reference to cutting edge therapies, and an updated appendix of ICD codes is included. An outstanding contribution to the literature, *Traumatic Brain Injury: A Clinician's Guide to Diagnosis, Management, and Rehabilitation, Second Edition*, again offers an invaluable resource for all providers who treat patients with TBI.

Assessment of the Department of Veterans Affairs Airborne Hazards and Open Burn Pit Registry National Academies of Sciences, Engineering, and Medicine 2017-04-28 Military operations produce a great deal of trash in an environment where standard waste management practices may be subordinated to more pressing concerns. As a result, ground forces have long relied on incineration in open-air pits as a means of getting rid of refuse. Concerns over possible adverse effects of exposure to smoke from trash burning in the theater were first expressed in the wake of the 1990-1991 Gulf War and stimulated a series of studies that indicated that exposures to smoke from oil-well fires and from other combustion sources, including waste burning, were stressors for troops. In January 2013, Congress directed the Department of Veterans Affairs (VA) to establish and maintain a registry for service members who may have been exposed to toxic airborne chemicals and fumes generated by open burn pits. *Assessment of the Department of Veterans Affairs Airborne Hazards and Open Burn Pit Registry* analyzes the initial months of data collected by the registry and offers recommendations on ways to improve the instrument and best use the information it collects. This report assesses the effectiveness of the VA's information gathering efforts and provides recommendations for

addressing the future medical needs of the affected groups, and provides recommendations on collecting, maintaining, and monitoring information collected by the VA's Airborne Hazards and Open Burn Pit Registry.

Handbook of Childhood Behavioral Issues Thomas P. Gullotta 2016-12-01 This handbook highlights present-day information and evidence-based knowledge in the field of children's behavioral health to enable practitioners, families, and others to choose and implement one of many intervention approaches provided. Using a standardized format, best practices for the prevention and treatment of many childhood behavioral disorders are identified based on current research, sound theory, and behavioral trial studies. This revision includes an integration of the DSM-5 diagnostic manual and new chapters on childhood psychosis and military families, and a thorough updating of the research in the previous edition.

Handbook of Military and Veteran Suicide Bruce Bongar 2017-03-30 For the past decade, suicidal behavior in military and veteran populations has been a constant feature in the news and in the media, with suicide rates among active duty American military personnel reaching their highest level in almost three decades. *Handbook of Military and Veteran Suicide* reviews the most advanced scientific understanding of the phenomenon of active duty and veteran suicide, while providing a useful, hands-on clinical guide for those working with this population. This comprehensive Handbook covers all relevant topics and current research in suicide in military and veteran populations, including links between suicide and PTSD, the stigma of mental health treatment in the military, screening for firearms access in military and veteran populations, "subintentioned" suicide (e.g. reckless driving and other such "accidental" deaths), women in combat, and working with families. Chapters also cover suicide risk assessment, ethical issues in treating suicidal patients, evidence-based treatments for PTSD, traumatic brain injury, and

managing suicide in older veterans. Significant issues that may arise in assessing and treating military and veteran populations who are at risk for suicide are presented and discussed with evidence-based and practical recommendations. This Handbook will benefit researchers, policy makers, and clinicians who work with active duty military and veteran populations.

Assessing U.S. Veterans' Work Role Functioning Lauren Kelly Osborne 2016 Since the beginning of military operations in Iraq and Afghanistan following the September 11, 2001 terrorist attacks that now characterize the Operation Iraqi Freedom (OIF) and Operation Enduring Freedom (OEF) combat eras, unique stressors and conditions have faced service members.

Advancements in military medicine have resulted in greater survival rates of combat veterans but have also increased rates of chronic psychological distress (Schnurr, Lunney, Bovin, & Marx, 2009). Research regarding these concerns has increased as these service members are now returning home and re-entering civilian life, and many studies show the detrimental effects of service on psychosocial functioning following combat including employment difficulties. As unemployment among veterans has dropped since the beginning of 2013 (U.S. Department of Labor, 2014), understanding how veterans are functioning in their new civilian work roles is the next step in better understanding their unique experiences of transitions (Strauser, Lustig, Cogdal, & Uruk, 2006). This study assessed the relationship between PTSS and current work role functioning among OIF and OEF veterans, including evaluation of the influence of personal variables such as reports of sense of coherence and vocational identity. Results of the study found PTSS and sense of coherence to predict work role functioning and PTSS to predict vocational identity in line with hypotheses. Further, sense of coherence was found to mediate the relationship between PTSS and work role functioning in support of hypotheses. Results indicate that sense of coherence does not moderate the relationship between PTSS and work role

functioning, nor does it moderate the relationship between PTSS and vocational identity. Additionally, vocational identity was not found to moderate the relationship between PTSS and work role functioning. Clinical implications, limitations, and directions for future research are addressed. --Page ii.

Psychiatric Casualties Mark Russell 2021-06-15 The psychological toll of war is vast, and the social costs of war's psychiatric casualties extend even further. Yet military mental health care suffers from extensive waiting lists, organizational scandals, spikes in veteran suicide, narcotic overprescription, shortages of mental health professionals, and inadequate treatment. The prevalence of conditions such as post-traumatic stress disorder is often underestimated, and there remains entrenched stigma and fear of being diagnosed. Even more alarming is how the military dismisses or conceals the significance and extent of the mental health crisis. The trauma experts Mark C. Russell and Charles Figley offer an impassioned and meticulous critique of the systemic failures in military mental health care in the United States. They examine the persistent disconnect between war culture, which valorizes an appearance of strength and seeks to purge weakness, and the science and treatment of trauma. Instead of reckoning with the mental health crisis, the military has neglected the needs of service members. It has discharged, prosecuted, and incarcerated a large number of people struggling with the psychological realities of war, and it has inflicted humiliation, ridicule, and shame on many more. Through a far-reaching historical account, Russell and Figley detail how the military has perpetuated a self-inflicted crisis. The book concludes with actionable prescriptions for change and a comprehensive approach to significantly improving military mental health.

Clinical Military Counseling Mark A. Stebnicki 2020-09-07 Clinical Military Counseling provides current research and ethical practice guidelines for the assessment, diagnosis, and mental

health treatment of active-duty service members, veterans, and military families in a 21st-century multicultural environment. Author Mark Stebnicki discusses contemporary military culture; the medical and psychosocial aspects of military health, including the neuroscience of military stress and trauma; suicide; chronic illnesses and disability; and blast and traumatic brain injuries. In addition, he offers integrative approaches to healing the mind, body, and spirit of service members and veterans dealing with clinical issues, such as spirituality, moral injury, and trauma; complex posttraumatic stress disorder and co-occurring mental health conditions; the stresses of the deployment cycle; and military career transitions. *Requests for digital versions from ACA can be found on www.wiley.com. *To purchase print copies, please visit the ACA website here *Reproduction requests for material from books published by ACA should be directed to permissions@counseling.org About the Author Mark A. Clear and Present Safety Michael A. Cohen 2019-03-26 An eye-opening look at the history of national security fear-mongering in America and how it distracts citizens from the issues that really matter What most frightens the average American? Terrorism. North Korea. Iran. But what if none of these are probable or consequential threats to America? What if the world today is safer, freer, wealthier, healthier, and better educated than ever before? What if the real dangers to Americans are noncommunicable diseases, gun violence, drug overdoses—even hospital infections? In this compelling look at what they call the “Threat-Industrial Complex,” Michael A. Cohen and Micah Zenko explain why politicians, policy analysts, academics, and journalists are misleading Americans about foreign threats and

ignoring more serious national security challenges at home. Cohen and Zenko argue that we should ignore Washington’s threat-mongering and focus instead on furthering extraordinary global advances in human development and economic and political cooperation. At home, we should focus on that which actually harms us and undermines our quality of life: substandard schools and healthcare, inadequate infrastructure, gun violence, income inequality, and political paralysis.

Gulf War and Health Institute of Medicine 2014-04-14 Since the United States began combat operations in Afghanistan in October 2001 and then in Iraq in March 2003, the numbers of US soldiers killed exceed 6,700 and of US soldiers wounded 50,500. Although all wars since World War I have involved the use of explosives by the enemy, the wars in Afghanistan and Iraq differ from previous wars in which the United States has been involved because of the enemy's use of improvised explosive devices (IEDs). The use of IEDs has led to an injury landscape different from that in prior US wars. The signature injury of the Afghanistan and Iraq wars is blast injury. Numerous US soldiers have returned home with devastating blast injuries and they continue to experience many challenges in readjusting to civilian life. *Gulf War and Health*, Volume 9 is an assessment of the relevant scientific information and draws conclusions regarding the strength of the evidence of an association between exposure to blast and health effects. The report also includes recommendations for research most likely to provide VA with knowledge that can be used to inform decisions on how to prevent blast injuries, how to diagnose them effectively, and how to manage, treat, and rehabilitate victims of battlefield traumas in the immediate aftermath of a blast and in the long term.

Parenting and Children's Resilience in Military Families Abigail H. Gewirtz 2016-06-10 This reference examines the wide-ranging impact of military life on families, parenting, and child development. It examines the complex family needs of this

diverse population, especially as familiar issues such as trauma, domestic violence, and child abuse manifest differently than in civilian life. Expert contributors review findings on deployed mothers, active-duty fathers, and other military parents while offering evidence for interventions and prevention programs to enhance children's healthy adjustment in this highly structured yet uncertain context. Its emphasis on resource and policy improvements keeps the book focused on the evolution of military families in the face of future change and challenges. Included in the coverage: Impacts of military life on young children and their parents. Parenting school-age children and adolescents through military deployments. Parenting in military families faced with combat-related injury, illness, or death. The special case of civilian service members: supporting parents in the National Guard and Reserves. Interventions to support and strengthen parenting in military families: state of the evidence. Military parenting in the digital age: existing practices, new possibilities. Addressing a major need in family and parenting studies, Parenting and Children's Resilience in Military Families is necessary reading for scholars and practitioners interested in parenting and military family research.

Depression in Special Populations, An Issue of Child and Adolescent Psychiatric Clinics of North America Karen Dineen Wagner 2019-05-11 This issue of Child and Adolescent Psychiatric Clinics will provide a comprehensive review of Depression in Special Populations within child and adolescent psychiatry. Guest edited by Drs. Karen Wagner and Warren Ng, this issue will discuss a number of related topics that are important to practicing child psychiatrists. This issue is one of four selected each year by our series Consulting Editor, Dr. Todd Peters. Articles in this volume include, but are not limited to: Foster care/child welfare; Juvenile Justice; Deaf and Hard of Hearing; African American/Latino; HIV and Depression; Children of military families; Depression in American Indian Youth;

Depression in Medically Ill Children; Youth Depression in School Settings; Sexual Minority Youth LGBTQ; Youth with Substance Use; Transitional Age Youth, and College Mental Health, among others.

American Sniper Chris Kyle 2015-02-13 Chris Kyle diente von 1999 bis 2009 bei den US Navy SEALs und verzeichnete in jener Zeit die höchste Zahl an tödlichen Treffern in der amerikanischen Militärgeschichte. 160 gezielte Liquidationen schreibt ihm das Pentagon offiziell zu. Seine Kameraden nannten ihn "Die Legende", seine Feinde "Teufel" ... In dieser eindringlichen Autobiografie erzählt der geborene Texaner, der 2013 erschossen wurde, die Geschichte seiner außergewöhnlichen Karriere. Nach dem 11. September 2001 wurde er im Kampf gegen den Terror an die Front geschickt und fand seine Berufung als Scharfschütze. Hart und ehrlich spricht Kyle über die Schattenseiten des Krieges und das brutale Handwerk des Tötens. Seine Frau Taya schildert in bewegenden Einschüben, wie der Krieg sich nicht nur auf ihre Ehe und ihre Kinder auswirkte, sondern auch auf ihren Mann. American Sniper ist das Psychogramm eines Scharfschützen und ein fesselnder Augenzeugenbericht aus dem Krieg, den nur ein Mann erzählen kann.

Servicemember and Veterans Rights Brian Clauss 2017-12-08 Designed for the busy practitioner, Servicemember and Veterans Rights contains Practice Notes setting out important take-aways and practical implications. For further convenience, longer sections are broken into subsections and make use of lists and bullet points. These user-friendly features will help you find just the right information quickly and easily. This indispensable practice aid covers the following critical issues and includes these features: • Chapter discussing all branches of the military, providing a general understanding of the different branches of the armed forces, their respective missions, and their organizational structures (Chapter 1); • Chapter on USERRA, providing an understanding of this federal law addressing

military leave and discrimination issues resulting from military service (Chapter 2); • Chapter on military family law providing an overview of family law issues practitioners will encounter when dealing with military members as clients or opposing parties (Chapter 4); • Chapter on TriCare and SGLI providing an important understanding of these principles and ensuring that Servicemembers, Veterans, and insurable dependents understand their rights, obligations, and privileges regarding TriCare and SGLI and SGLI related benefits (Chapter 5).

Preventing Psychological Disorders in Service Members and Their Families Institute of Medicine 2014-02-11 Being deployed to a war zone can result in numerous adverse psychological health conditions. It is well documented in the literature that there are high rates of psychological disorders among military personnel serving in Operation Enduring Freedom in Afghanistan and Operation Iraqi Freedom in Iraq as well as among the service members' families. For service members' families, the degree of hardship and negative consequences rises with the amount of the service members' exposure to traumatic or life-altering experiences. Adult and child members of the families of service members who experience wartime deployments have been found to be at increased risk for symptoms of psychological disorders and to be more likely to use mental health services. In an effort to provide early recognition and early intervention that meet the psychological health needs of service members and their families, DOD currently screens for many of these conditions at numerous points during the military life cycle, and it is implementing structural interventions that support the improved integration of military line personnel, non-medical caregivers, and clinicians, such as RESPECT-Mil (Re-engineering Systems of Primary Care Treatment in the Military), embedded mental health providers, and the Patient-Centered Medical Home. Preventing Psychological Disorders in Service Members and Their Families evaluates risk and protective factors in military and family

populations and suggests that prevention strategies are needed at multiple levels - individual, interpersonal, institutional, community, and societal - in order to address the influence that these factors have on psychological health. This report reviews and critiques reintegration programs and prevention strategies for PTSD, depression, recovery support, and prevention of substance abuse, suicide, and interpersonal violence.

Returning Home from Iraq and Afghanistan Institute of Medicine 2013-04-12 As of December 2012, Operation Enduring Freedom (OEF) in Afghanistan and Operation Iraqi Freedom (OIF) in Iraq have resulted in the deployment of about 2.2 million troops; there have been 2,222 US fatalities in OEF and Operation New Dawn (OND)¹ and 4,422 in OIF. The numbers of wounded US troops exceed 16,000 in Afghanistan and 32,000 in Iraq. In addition to deaths and morbidity, the operations have unforeseen consequences that are yet to be fully understood. In contrast with previous conflicts, the all-volunteer military has experienced numerous deployments of individual service members; has seen increased deployments of women, parents of young children, and reserve and National Guard troops; and in some cases has been subject to longer deployments and shorter times at home between deployments. Numerous reports in the popular press have made the public aware of issues that have pointed to the difficulty of military personnel in readjusting after returning from Iraq and Afghanistan. Many of those who have served in OEF and OIF readjust with few difficulties, but others have problems in readjusting to home, reconnecting with family members, finding employment, and returning to school. In response to the return of large numbers of veterans from Iraq and Afghanistan with physical-health and mental-health problems and to the growing readjustment needs of active duty service members, veterans, and their family members, Congress included Section 1661 of the National Defense Authorization Act for fiscal year 2008. That section required the secretary of defense, in consultation with the

secretary of veterans affairs, to enter into an agreement with the National Academies for a study of the physical-health, mental-health, and other readjustment needs of members and former members of the armed forces who were deployed in OIF or OEF, their families, and their communities as a result of such deployment. The study consisted of two phases. The Phase 1 task was to conduct a preliminary assessment. The Phase 2 task was to provide a comprehensive assessment of the physical, psychological, social, and economic effects of deployment on and identification of gaps in care for members and former members, their families, and their communities. The Phase 1 report was completed in March 2010 and delivered to the Department of Defense (DOD), the Department of Veterans Affairs (VA), and the relevant committees of the House of Representatives and the Senate. The secretaries of DOD and VA responded to the Phase 1 report in September 2010. *Returning Home from Iraq and Afghanistan: Assessment of Readjustment Needs of Veterans, Service Members, and Their Families* fulfills the requirement for Phase 2.

Pocket Guide to Psychiatric Nursing Karyn I Morgan

2020-09-08 Here's the most complete and easy-to-use resource on how to develop practical, individualized plans of care for psychiatric and mental health patients. It's the perfect quick reference now for clinical rotations...and later for practicing nurses. This Pocket Guide is really two books in one! The first half provides the diagnostic information needed to create a care plan; the second half covers the safe prescription and administration of psychotropic medications. And, the concepts can be applied in a variety of healthcare settings...from in-patient hospitalization through the outpatient clinic...to home health and private practice.

Treatment for Posttraumatic Stress Disorder in Military and Veteran Populations Institute of Medicine 2014-06-17

Posttraumatic stress disorder (PTSD) is one of the signature

injuries of the U.S. conflicts in Afghanistan and Iraq, but it affects veterans of all eras. It is estimated that 7-20% of service members and veterans who served in Operation Enduring Freedom and Operation Iraqi Freedom may have the disorder. PTSD is characterized by a combination of mental health symptoms - re-experiencing of a traumatic event, avoidance of trauma-associated stimuli, adverse alterations in thoughts and mood, and hyperarousal - that last at least 1 month and impair functioning. PTSD can be lifelong and pervade all aspects of a service member's or veteran's life, including mental and physical health, family and social relationships, and employment. It is often concurrent with other health problems, such as depression, traumatic brain injury, chronic pain, substance abuse disorder, and intimate partner violence. The Department of Defense (DoD) and the Department of Veterans Affairs (VA) provide a spectrum of programs and services to screen for, diagnose, treat for, and rehabilitate service members and veterans who have or are at risk for PTSD. The 2010 National Defense Authorization Act asked the Institute of Medicine to assess those PTSD programs and services in two phases. The Phase 1 study, *Treatment for Posttraumatic Stress Disorder in Military and Veteran Populations: Initial Assessment*, focused on data gathering. *Treatment for Posttraumatic Stress Disorder in Military and Veteran Populations Final Assessment* is the report of the second phase of the study. This report analyzes the data received in Phase 1 specifically to determine the rates of success for each program or method. *Treatment for Posttraumatic Stress Disorder in Military and Veteran Populations Final Assessment* considers what a successful PTSD management system is and whether and how such a system is being implemented by DoD and VA. This includes an assessment of what care is given and to whom, how effectiveness is measured, what types of mental health care providers are available, what influences whether a service member or veteran seeks care, and what are the costs associated

with that care. This report focuses on the opportunities and challenges that DoD and VA face in developing, implementing, and evaluating services and programs in the context of achieving a high-performing system to care for service members and veterans who have PTSD. The report also identifies where gaps or new emphases might be addressed to improve prevention of, screening for, diagnosis of, and treatment and rehabilitation for the disorder. The findings and recommendations of *Treatment for Posttraumatic Stress Disorder in Military and Veteran Populations: Final Assessment* will encourage DoD and VA to increase their efforts in moving toward a high-performing, comprehensive, integrated PTSD management strategy that addresses the needs of current and future service members, veterans, and their families.

Military Health Care Jomana Amara 2013-09-02 This edited volume surveys critical aspects of modern military health care in the US and various other Western countries with troops in Iraq and Afghanistan. In the United States, the military medical system, including care for veterans, is large and diverse and involves two institutions, the US Department of Defense (DoD) and the US Department of Veteran's Affairs (VA). Studying the system gives practitioners and policy-makers an understanding of the larger picture of the military medical structure, facilitating thought about some of the difficulties and opportunities for coordinating treatments and preparing for the future. This book covers health care issues prior to deployment, such as screening for mental health, evaluating long-term consequences of exposure to military service, and provision of insurance; care during a conflict, primarily battlefield clinics, battlefield trauma care, and evacuation procedures; and post-combat care, including serious war injuries, psychiatric, and long-term care. Bringing together research from a wide range of contributors, the volume provides readers with an extensive, up-to-date source of information on military medicine. This book will be of great interest to students

of public health, military sociology, the Iraq war, US public policy, and war and conflict studies in general.

Signature Wounds David Kieran 2019-04-02 The surprising story of the Army's efforts to combat PTSD and traumatic brain injury The wars in Iraq and Afghanistan have taken a tremendous toll on the mental health of our troops. In 2005, then-Senator Barack Obama took to the Senate floor to tell his colleagues that "many of our injured soldiers are returning from Iraq with traumatic brain injury," which doctors were calling the "signature wound" of the Iraq War. Alarming stories of veterans taking their own lives raised a host of vital questions: Why hadn't the military been better prepared to treat post-traumatic stress disorder (PTSD) and traumatic brain injury (TBI)? Why were troops being denied care and sent back to Iraq? Why weren't the Army and the VA doing more to address these issues? Drawing on previously unreleased documents and oral histories, David Kieran tells the broad and nuanced story of the Army's efforts to understand and address these issues, challenging the popular media view that the Iraq War was mismanaged by a callous military unwilling to address the human toll of the wars. The story of mental health during this war is the story of how different groups—soldiers, veterans and their families, anti-war politicians, researchers and clinicians, and military leaders—approached these issues from different perspectives and with different agendas. It is the story of how the advancement of medical knowledge moves at a different pace than the needs of an Army at war, and it is the story of how medical conditions intersect with larger political questions about militarism and foreign policy. This book shows how PTSD, TBI, and suicide became the signature wounds of the wars in Iraq and Afghanistan, how they prompted change within the Army itself, and how mental health became a factor in the debates about the impact of these conflicts on US culture.

Suicide Risk Assessment Practices in the United States Military Tseha Amidan 2014 Suicide rates in the United States Military

have increased since the start of Operation Enduring Freedom (OEF) and Operation Iraqi Freedom (OIF). Among the U.S. armed forces personnel suicide has become an increasing problem, not only among active duty servicemen and women, but for veterans as well. Suicide may occur before, during, or after the actual deployment for various reasons, which may not be directly related to active duty (Jackson & Branson, 2012). The United States has deployed approximately 1.5 million troops to Iraq and Afghanistan as part of OEF and OIF (Tuerk, Yoder, Ruggiero, Gros, & Acierno, 2010). Soldier suicides reached a three-decade high in 2008 (Gomulka, 2010). The majority of troops returning home will adjust well, but a significant number of them return with serious mental health problems. Careful and conservative estimates translate into tens of thousands of troops needing mental health services (Tuerk et al., 2010). Recent federal reports conclude that mental health diagnoses, including PTSD, were rated as the second leading cause of combat injury (Wood et al., 2009). The focus of this study was on the clinical practices of military psychologists who work both on and off the field providing mental health services. The goal of this study was to stimulate direct engagement in an attempt to gather the most current data regarding the actual practices used to conduct suicide risk assessment. This study will also present information evaluating psychologists' views about their professional training, as well as their perception of the effectiveness of various programs that the military is offering.

Intersections between Mental Health and Law among Veterans

Jack Tsai 2019-11-30 Written by experts in the field, this book addresses the serious and increasingly public concern over the mental health of veterans after military deployment. It examines the intersection of criminal and civil legal issues with mental problems in the veteran population and describes various effective programs that have been developed to address these issues. It includes a wide range of useful topics examining the

particular criminal justice problems faced by vets, such as sexual abuse and violence as well as the legal institutions that have been established to handle these problems, such as veterans courts, family courts, and the Veterans Justice Outreach program. The book also provides coverage of special groups such as women and homeless veterans. It is a concise but comprehensive view of this salient topic that is useful for students, practitioners, and policy makers.

Handbook of Fathers and Child Development Hiram E. Fitzgerald 2020-10-01 This handbook provides a comprehensive review of the impact of fathers on child development from prenatal years to age five. It examines the effects of the father-child relationship on the child's neurobiological development; hormonal, emotional and behavioral regulatory systems; and on the systemic embodiment of experiences into the child's mental models of self, others, and self-other relationships. The volume reflects two perspectives guiding research with fathers: Identifying positive and negative factors that influence early childhood development, specifying child outcomes, and emphasizing cultural diversity in father involvement; and examining multifaceted, specific approaches to guide father research. Key topics addressed include: Direct assessment of father parenting (rather than through maternal reports). The effects of father presence (in contrast to father absence). The full diversity of father involvement. Father's impact on gender role differentiation. Father's role in triadic interactions of family dynamics. Father involvement in psychotherapeutic family interventions. This handbook draws from converging perspectives about the role of fathers in very early child development, summarizes what is known, and, within each chapter, draws attention to the critical questions that need to be answered in coming decades. The Handbook of Fathers and Child Development is a must-have resource for researchers, graduate students, and clinicians, therapists, and other professionals in infancy and early child development, social work, public health,

developmental and clinical child psychology, pediatrics, family studies, neuroscience, juvenile justice, child and adolescent psychiatry, school and educational psychology, anthropology, sociology, and all interrelated disciplines.

Crisis in the American Heartland -- Coming Home George W. Doherty 2013-03-01 Veterans in rural communities face unique challenges, who will step up to help? Beginning with a brief scenario of a more gentle view of rural life, the book moves through learned information about families, children, and our returning National Guard and Reserve civilian military members. Return experiences will necessarily be different in rural and frontier settings than they are in suburban and urban environments. Our rural and frontier areas, especially in Western states with more isolated communities, less developed communication and limited access to medical, psychological and social services remain an important concern. This book helps provide some informed direction in working toward improving these as a general guide for mental health professionals working with Guard and Reserve members and families in rural/frontier settings. An appendix provides an in-depth list of online references for Traumatic Brain Injury (TBI). Specific areas of concern include: Morale, deployment abroad, and stress factors Effects of terrorism on children and families at home Understanding survivor guilt Post Traumatic Stress Disorder (PTSD) and suicide Preventing secondary traumatization Resiliency among refugee populations and military families Adjustment and re-integration following the Iraq and Afghanistan Wars Vicarious trauma and its effects on children and adults How rural and remote communities differ from more urban ones following war experiences in readjusting military members

Characteristics important in therapists/counselors working with returning military Doherty's second volume in this new series "Crisis in the American Heartland" explores these and many other issues. Psychological Assessment of Veterans Dr. Shane S. Bush 2014-07-30 Psychological assessment is practiced in wide-ranging settings to address the varied clinical and administrative needs of veteran populations. Such assessment blends record review, clinical interviews of the veteran and collateral sources of information, behavioral observations, and psychological testing. This book promotes the care and well-being of veterans by bringing together knowledgeable and experienced psychologists to discuss a range of psychological assessment methods and procedures. It aims to help patients and their families, healthcare providers, and concerned citizens gain an improved understanding of veterans' cognitive functioning, emotional states, personality traits, behavioral patterns, and daily functioning. The book begins with a history of the psychological assessment of veterans and investigates its efficacy in different settings, including outpatient mental health, long-term care, primary care, home-based primary care, and telemental health. Later chapters address assessment of a variety of disorders or presenting problems, including substance use disorders, psychotic disorders, mood disorders and suicidal thoughts and behavior, PTSD and other anxiety disorders, attention-deficit/hyperactivity disorder, dementia, pain and pain-related disorders, and polytrauma. The book concludes with important special considerations, including assessment of symptom and performance validity, assessment of homeless veterans and health-related quality of life, and ethical, legal, and professional

issues. Psychological Assessment of Veterans provides an essential reference and guide for clinical psychologists, including those working in the subspecialties, and psychology trainees who work with veterans.

The Evolution of U. S. Military Policy from the Constitution to the Present M. Wade Markel 2020-06-30

The authors show that there is no such thing as a "traditional" U.S. military policy. Rather, the laws that authorize, empower, and govern the U.S. armed forces emerged from long-standing debates and legislative compromises between 1903 and 1940.

Returning Home from Iraq and Afghanistan Institute of Medicine 2010-03-31 Nearly 1.9 million U.S. troops have been deployed to Afghanistan and Iraq since October 2001. Many service members and veterans face serious challenges in readjusting to normal life after returning home. This initial book presents findings on the most critical challenges, and lays out the blueprint for the second phase of the study to determine how best to meet the needs of returning troops and their families.
